

# The Life Cycle of Amphibians

Amphibians have many stages to their life cycles unlike us humans. Most amphibians lay their eggs in the water where they will hatch and spend the first part of their life in the water and look different from their adult forms. As they grow they will slowly look more and more like adults eventually becoming a semi-aquatic adult. Some amphibians skip this aquatic stage, and some stay in the aquatic larval stage their entire lives but most share this same life cycle.

**Go out and find each stage of the amphibian life cycle! try and ID the species if you can, and either take a photo to add to the circle for each stage or draw each stage instead!**
